In this project we will build a simple social media account management system. This system can be thought as a mechanism of storing certain information and changing this information. Our system is divided into two parts:

- Registration Part
- User Part

Registration Part

When you start the program you will be asked if you have an account. Our registration part will ask you to set a username and password for your account. While a user setting her/his password it will ask for confirmation by entering it once again.

In addition, password must contain at least eight characters, of which at least one must be symbol, digit and uppercase letter. If the password is not suitable for the circumstances it will notify the user about how it should be. If it is suitable it will add your account to database.

After all this process, the user will be allowed to log into his/her account.

User Part

This part is accessed if the user after user login. User part of our system comes up with a menu. The user can access the desired functions through this menu. Some methods and their functions are given below we want to have are:

- Changing Password
- Changing Username
- Adding Friends: Since our program is similar to social media platforms, it has a function that will allow you to add existing users as friends.
- Delete Friends: Since our program is similar to social media platforms, it has a function that will allow you to delete existing users from your friend list.
- Show Account Details: You can show your account details like username and password.
- Show Friend List: It will help you to view your friends.
- Exit Program
